

Nikol Beauty — Design Consistency Audit

Theme: `shopify-live` (Broadcast 5.5.0) · Scope: buttons, fonts, font size, form fields · Prepared 2026-06-30

CONNECTED setting works **PARTIAL** works for some elements **BROKEN/MISSING** not wired or doesn't exist

Headline: The theme ships with a complete, well-built settings system for buttons, typography, and form fields. The non-uniformity you're seeing comes from the **previous agency**, which (a) severed some setting-to-CSS connections, (b) built two parallel styling systems, and (c) hardcoded colors, fonts, and sizes inside individual sections instead of using the theme's design tokens. **Good news:** every unique page is built from native theme sections — there is *no* ZipifyPages dependency — so all of this is fixable in the theme.

Status at a glance

Element	Is the setting connected?	Where to control it	Core problem
Button colors (primary / secondary)	PARTIAL	Settings → <i>Buttons</i> (primary & secondary bg/text/border, font, size, caps, shape)	Settings are wired to native buttons, but ~11 custom sections hardcode the pink <code>#D34270</code> and ignore them.
Font family (consistency)	BROKEN	Settings → <i>Typography</i> (font pickers)	Font pickers are disconnected (body/heading hardcoded). Sections request <code>'Inter'</code> , which the site never loads → falls back to a system font.
Font size (18px desktop min)	MISSING	Settings → <i>Typography</i> → Base size (relative %, not px)	No absolute px control exists; sections hardcode their own sizes. Must hardcode or create a setting.
Form fields	PARTIAL	No single setting; styled in CSS	Native fields are styled consistently, but custom sections & apps each define their own field look (borders, sizes, padding, placeholder).

1 · Button colors

CONNECTED to native buttons **bypassed** by custom sections

Theme Settings → **Buttons** has full controls — Primary & Secondary *background / text / border* colors, plus button font, size, letter-spacing, caps, and shape (square/rounded/pill). These feed CSS variables (`--BTN-PRIMARY-*` , `--BTN-SECONDARY-*`) and the theme's native `.btn` / `.cta` buttons use them correctly. **So the setting works** — for native buttons (cart, product add-to-cart, contact submit, the Videos page CTA, etc.).

The problem: the agency's custom sections paint their buttons with a hardcoded pink `#D34270` and their own font/size, so they don't respond to the Buttons settings and can drift from each other.

Element / Button	Appears on (page)	Problem	Recommended fix
Hero banner button — <code>custom-hero-banner</code>	Home /	Hardcoded <code>#D34270</code> , Cormorant, fixed size	Use <code>.btn</code> / <code>var(--BTN-PRIMARY-*)</code>
Info-banner button — <code>custom-info-banner</code>	Product (Coming-soon) templates	Hardcoded <code>#D34270</code>	Route to primary button token
Newsletter button — <code>custom-newsletter</code>	Coming-soon product / alt home	Hardcoded <code>#D34270</code>	Route to primary button token
Video carousels — <code>cw-videos</code> , <code>cw-videosv2</code>	Alt home / Coming-soon	Hardcoded <code>#D34270</code> (now self-contained but still hardcoded)	Route to primary button token
Steps / Alternating / Benefits / Slider / Collection-banners /	Home, product templates	Hardcoded <code>#D34270</code> in <code>custom-steps-*</code> , <code>custom-alternating-rows</code> , <code>custom-collection-banners</code> ,	Route to primary/secondary

Icon-features		<code>custom-icon-features</code> , <code>custom-product-slider</code>	token
Legacy PDP CSS — <code>snippets/cw-pdp-css.liquid</code>	Product templates	Hardcoded <code>#D34270</code>	Replace with token or remove if dead

Your options:

- **(A — recommended)** Point every custom-section button at the theme's button token (one CSS variable / the `.btn` class). Then the Buttons settings control the whole site, and primary vs secondary becomes a real, themeable choice.
- **(B)** Leave them hardcoded but standardize on one hex. Quick, but the settings still won't drive them and future changes mean editing many files.

Note: confirm the intended Primary/Secondary values in Settings → Buttons; today Primary is effectively the pink used ad-hoc. We can set Primary = pink and define a Secondary for outline/alt buttons.

2 · Font family & consistency

Font pickers disconnected

'Inter' not loaded

Problem A — the Typography font pickers do nothing

In `snippets/css-variables.liquid` the agency hardcoded `--FONT-STACK-BODY: 'Jost'` and `--FONT-STACK-HEADING: 'Cormorant'` and commented out the dynamic `type_base_font` / `type_heading_font` pickers. So changing the fonts in Theme Settings → Typography has **no effect** — the body is locked to Jost and headings to Cormorant.

Problem B — sections use 'Inter', which the site never loads

The site loads only **Cormorant, DM Serif Display, and Jost** (Google Fonts, in `layout/theme.liquid`). But ~18 sections set `font-family: 'Inter'` for body text. Because Inter isn't loaded, those areas fall back to the browser's default sans-serif — *neither* Jost (the theme's body font) *nor* Inter. That's the main reason body text looks different from section to section.

Problem C — two parallel styling systems

Newer sections (`cw-*` / `custom-*`) carry their font rules *inline* in each `.liquid` file; the original agency sections (`about-*` , `videos-*` , `meet-niko1` , `testimonials` , `subscribe-form` , `video-product` , `section-highlights`) are styled in compiled `main.css` . Headings are Cormorant in both (consistent); body text is the inconsistent part.

WHERE	HEADING FONT	BODY FONT (AS WRITTEN)	BODY FONT (AS RENDERED)
Native theme	Cormorant ✓	Jost (var)	Jost ✓ (loaded)
Custom sections (inline)	Cormorant ✓	'Inter'	system fallback (Inter not loaded)
Original agency sections (main.css)	Cormorant ✓	mix of var / 'Inter'	mix of Jost & fallback

Your options (font family):

- **(A — recommended)** Pick **one** body font and apply it everywhere via the variable. Decision needed: **Jost** (already loaded, current theme body) or **Inter** (then we must actually load Inter). Then replace every hardcoded `'Inter'` / `'Jost'` with `var(--FONT-STACK-BODY)` .
- **(B)** Reconnect the Typography pickers (re-enable the dynamic lines) so you can change fonts from Settings later — can be done together with (A).

3 · Font size — 18px minimum on desktop

No setting exists for this

Typography → "Base size" is a **percentage scale** ($100 \approx 16\text{px}$) applied via `--FONT-SIZE-BASE` ; there is no absolute pixel control and no "minimum 18px" concept. Custom sections also hardcode body sizes (16/18/20px) that ignore the scale, so bumping the scale won't uniformly hit 18px.

Your options (font size) — you asked for this choice explicitly:

- **(A — recommended)** Create a **setting**: add a "Desktop base font size (px)" control in Settings → Typography, wire it into `--FONT-SIZE-BASE` , and make the body text use it. You'd then set 18px (or anything) yourself, no code changes later.

- **(B) Hardcode:** set an 18px desktop floor directly in CSS. Fast, but not editable from the dashboard, and the hardcoded section sizes still need normalizing to honor it.

Either way, the hardcoded per-section font sizes should be normalized so 18px actually holds across sections.

4 · Form fields

Native fields consistent

custom forms diverge

The theme styles native inputs/selects/textareas consistently (border, radius, padding 9×16, body font, body size). But several forms override this with their own look, so fields don't match across the site.

FORM / FIELD	PAGE	HOW IT DIFFERS FROM THE NATIVE FIELD
Contact form (<code>.field</code>)	Contact <code>/pages/contact</code>	Underline-only border (no box, no radius), vertical-only padding
About-page contact form (<code>about-contact</code>)	About <code>/pages/about</code>	Hardcoded overrides: <code>border-color:white !important</code> , <code>font-size:12px</code> , <code>font-weight:300</code> — smallest, thinnest fields on the site
Newsletter form	Footer (all pages) / homepage subscribe	Underline-only border, no radius, placeholder at 75% opacity
Small / sticky newsletter	Sticky signup	Different padding (10px 0), full-opacity placeholder, different font-size var
Search forms (main + popdown)	Search / header	No border, padding 15px, nav-font & nav-size (differs from body)
Coming-soon "Notify me" form	Coming-soon product template	Inline-styled, separate from all the above
Comment / account forms	Article, Account	Different max-width & textarea heights

Inconsistencies span: border style (box vs underline vs none), border-radius (token vs 0), padding (9×16 vs 1em 0 vs 15px vs 10px 0), font-size (body var vs 12px vs nav var), and placeholder color (75% vs 100% opacity).

Your options (forms):

- **(A — recommended)** Define one shared field style (the native field is the natural base) and route the custom/section forms to it; remove the one-off overrides (especially the About form's white-border/12px/300-weight). Optionally expose border-style and radius as settings.
- **(B)** Keep intentional variants (e.g., a minimalist underline for newsletter) but codify them as 2–3 named styles instead of ad-hoc per form.

Appendix · Unique pages & where issues live

Product and collection pages are excluded as duplicates. No page uses ZipifyPages — all native sections.

PAGE	LINK	RELEVANT SECTIONS	ISSUES PRESENT
Homepage	<code>/</code>	custom-guarantee-list, custom-hero-banner, custom-customer-quote, section-highlights, review-swiper-card, meet-nikol, yt-videos-list, video-product, testimonials, subscribe-form	Buttons (hero), Inter fallback, mixed font sizes, newsletter field
About	<code>/pages/about</code>	about-header, about-two-columns, about-quote-image, about-text-grid, about-contact	About contact form (white border, 12px, weight 300); body font
Contact	<code>/pages/contact</code>	contact-form	Underline field style differs from boxed native fields
Videos	<code>/pages/videos</code>	videos-featured, videos-filter, yt-videos-list	Body font; CTA uses native <code>.cta</code> (OK)
FAQ	<code>/pages/faq</code>	section-columns	Mostly stock; check body font/size
Blog	<code>/blogs/news</code>	blog	Stock; body font/size

Article	<code>/blogs/news/<post></code>	new-article	Comment form max-width/heights differ
Cart	<code>/cart</code>	cart	Stock; uses native buttons (OK)
Search	<code>/search</code>	search	Search field font differs (nav vs body)
Story / Team / Lookbook / Best-sellers	<code>/pages/<handle></code>	section-custom-content, section-columns, section-look, main-page	Mostly stock; verify body font/size
Beauty Reinvented / Rewards	<code>/pages/beauty-reinvented ,</code> <code>/pages/rewards</code>	fully custom Liquid / Yotpo embed	Self-contained; out of normal section system

Recommended sequence & decisions needed from you

1. **Decide the body font:** Jost (loaded now) or Inter (we'll load it). → unblocks the font work.
2. **Decide font-size approach:** create a "Desktop base size (px)" setting (recommended) vs hardcode 18px.
3. **Confirm Primary/Secondary button colors** in Settings → Buttons, then rewire the custom sections to those tokens.
4. **Approve one shared form-field style** (native field as the base) and removal of the About-form overrides.

Once these four decisions are made, the fixes are mostly find-and-replace of hardcoded values with the theme's design tokens (variables/classes), plus reconnecting two lines in `css-variables.liquid` and (optionally) adding 1–2 new settings. All in-theme, no app changes.
